Amazon India web checkout

UX evaluation & redesign

Cart → delivery → payment → review → confirmation → cancellation

Objective

Make the final cost, choices, editing and recovery easier to understand, then validate with shoppers.

7 genuine desktop captures • 1 placed and cancelled COD order

User and checkout journey

Assumption-based persona

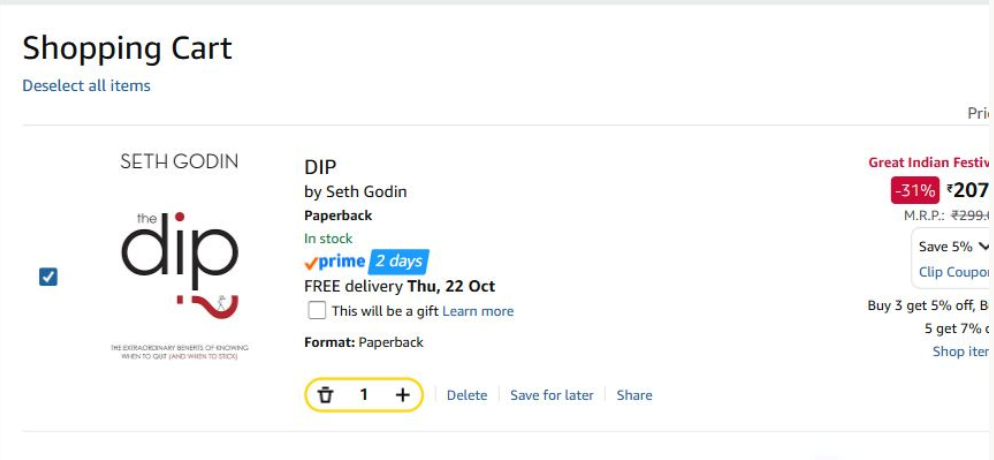

An India-based desktop shopper who wants to confirm the payable amount, choose delivery and payment, and know whether the order succeeded.

Context

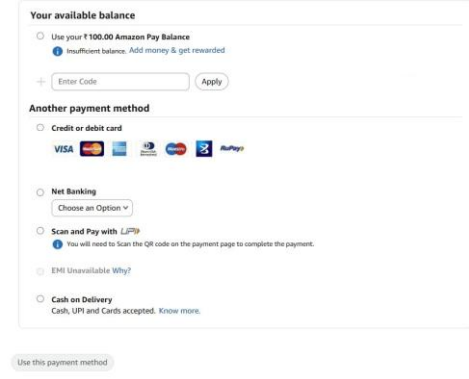

Signed-in Amazon India web checkout; a ₹207 book, cash on delivery, ₹7 fee, ₹214 final total.

01	**Cart**	Item and quantity
02	**Address**	Saved choices
03	**Payment**	Method selection
04	**Delivery**	Speed choice
05	**Review**	₹214 total
06	**Outcome**	Place and cancel

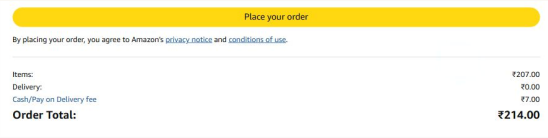

Observed current experience

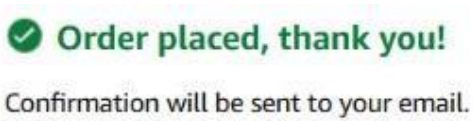

Cart: item, quantity, coupon and delivery promise

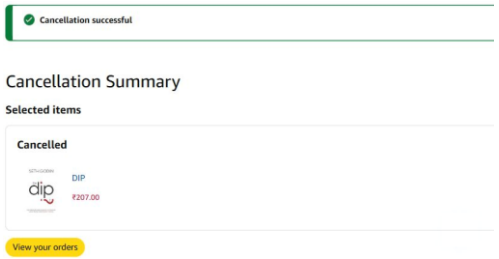

Payment methods

Review: ₹207 + ₹7 COD fee = ₹214

Order placed; then successfully cancelled

No payment failure was encountered or captured.

Nielsen heuristic audit

Observed interface facts support the questions below; user impact needs testing.

ID	Evaluation question	Heuristic	Evidence boundary	Risk
01	**Final cost clarity**	**Visibility of status**	**Review shows ₹7 COD fee**	**3/4**
02	Choice overload	Minimalist design	Coupon and extra-choice screens	2/4
03	Edit without rework	User control	Change links at review	3/4
04	Payment language	Real-world match	Card, UPI, COD labels	2/4
05	Failure recovery	Error recovery	Failure evidence missing	4/4
06	Primary control ease	Efficiency of use	Controls visible; targets unmeasured	2/4

All six are hypotheses; severity scores are provisional. No participant usability test has been run.

UX laws as design considerations

Hick’s Law

UX-02 · HYPOTHESIS

Many choices can slow decisions.

Group delivery and payment choices; reveal secondary details when needed.

Measure selection time.

Fitts’s Law

UX-06 · HYPOTHESIS

Small or distant controls take more effort to acquire.

Use clear, adequately sized primary and Edit controls.

Measure missed clicks.

Jakob’s Law

UX-03 · HYPOTHESIS

Shoppers expect familiar checkout editing patterns.

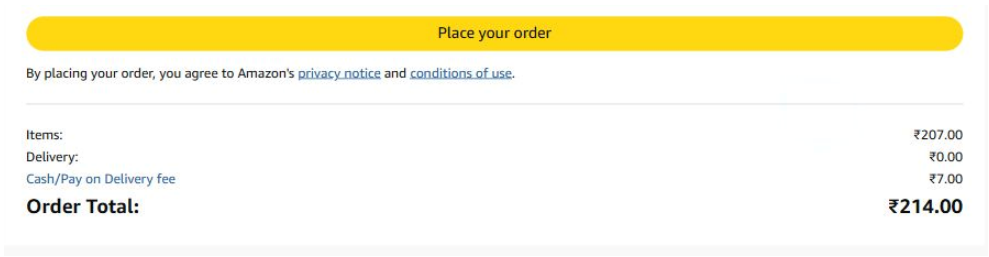

Keep direct Edit links and preserve earlier choices.

Measure wrong turns.

These laws guide the redesign; the screenshots alone do not establish a violation.

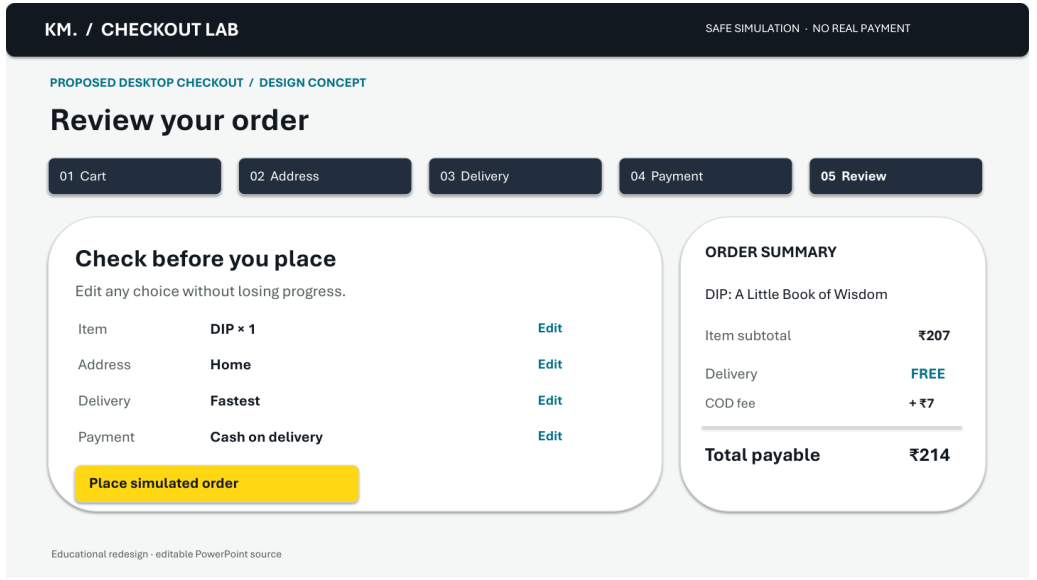

Before / after: review and recovery

BEFORE · observed Amazon review

The ₹7 COD fee and ₹214 final total are visible. Whether shoppers notice the fee is untested.

AFTER · proposed design concept

Clear fee · explicit total · direct Edit actions

Prototype: kunalmahurkar.is-a.dev/amazon-checkout-prototype/

Priorities, measures and next test

Priority

P1 Payment recovery + price clarity

P2 Editing, choices and terminology

P3 Primary control polish

Five-participant validation plan

Recruit India-based desktop shoppers with varied checkout familiarity. Ask them to change an address, inspect the payable total, select payment and recover from a simulated failure.

Success measures

Completion / abandonment · time and clicks · failure recovery · cost clarity · unaided task success

Baseline not measured. No usability sessions have been conducted. Prototype: kunalmahurkar.is-a.dev/amazon-checkout-prototype/
